

DAST Scanner Statement — AI Email Reply Generator

DAST Scanner Statement — AI Email Reply Generator

Company: MDS LLC **Contact:** omorgun@morgunsolutions.com **Package:** AI Email Reply Generator (namespace: aiemailreply, API v60.0) **Package Version:** 1.14.0.1 (04tdM000000STYXQA4) **Date:** May 7, 2026

Statement

Dynamic Application Security Testing (DAST) is not applicable to this solution.

MDS LLC does not own, operate, or control any external web application, API endpoint, web service, mobile application, or server-side infrastructure. There is no ISV-hosted component in this solution to scan.

Architecture Summary

AI Email Reply Generator is a **100% native Salesforce Lightning managed package**. All application logic, data storage, and user interface run entirely within the **customer’s Salesforce org**. MDS LLC has no presence in the data path.

Component	Location	Owner
LWC components (UI)	Customer’s Salesforce org	Runs in customer’s org
Apex controllers & services	Customer’s Salesforce org	Runs in customer’s org
Custom object (AI_Email_Reply_Draft__c)	Customer’s Salesforce org	Customer’s data
Custom Metadata Types (config)	Customer’s Salesforce org	Customer’s org
Named Credentials (4)	Customer’s Salesforce org	Customer-configured
AI provider API endpoint	Customer’s own AI provider account	Customer-owned
ISV servers / APIs / databases	None	N/A

Why DAST Does Not Apply

The Salesforce ISVforce Guide states that external endpoints are in scope for DAST when either of these criteria are true:

1. The endpoint plays a role in **authenticating the end user** as part of buying, getting support for, or using the solution.
2. **Salesforce data is transferred to or from the endpoint** (i.e., the ISV controls the endpoint).

Neither criterion applies here:

Criterion 1 — Authentication: The solution uses only Salesforce's native authentication. No MDS LLC-owned endpoint participates in user authentication at any point.

Criterion 2 — Data at an ISV-controlled endpoint: The only external callout made by this package is an HTTPS POST from the customer's Salesforce org to the customer's own AI provider (OpenAI, Anthropic, Google Gemini, or xAI), using the **customer's own API key** stored in the customer's own Named Credential. MDS LLC:

- Does not own or operate any of these AI provider endpoints
- Does not have access to the customer's API key
- Does not receive, intercept, store, or process any data flowing through these callouts
- Cannot obtain permission to run an active DAST scan against third-party production APIs (OpenAI, Anthropic, Google, xAI)

Data Flow Confirmation

Customer's Salesforce Org

↓
HTTPS (Named Credential — customer-configured)
↓

Customer's AI Provider (OpenAI / Anthropic / Google / xAI)
(Customer's own account, customer's own API key)

MDS LLC is NOT in this data path at any point.

No data flows through any MDS LLC-controlled system, server, or endpoint — before, during, or after the AI callout. There is no ISV endpoint to target with a DAST scanner.
